

Proplity

AI-Powered Property Management

Step-by-Step Flow Guide

Every click, tap, and multi-person flow in Proplity, walked through in order — verified against a live, running build, not just written from the design.

Covers

Visitor, Tenant, Landlord, Manager,
Vendor, Admin + cross-role flows

Verified

Click-by-click against a
seeded, live deployment

Format

Numbered steps, in the order
you'll actually do them

Every flow below was walked through click by click against a real, seeded database — not just read from the code — including the flows where two or three people (e.g. a tenant and a manager, or a manager and a vendor) act at the same time and need to see each other's actions. Each numbered list is the exact sequence of clicks/taps a person would follow.

Before you start: what depends on configuration

A few flows depend on external services being configured for this specific deployment (an email provider, a file-storage provider, a payment provider). If one isn't configured yet, the app doesn't break or behave unpredictably — it clearly says "not available" instead of silently failing.

- **Email** (verification links, password reset, tenant invites) — real delivery requires an email provider key.
 - **Photo/document uploads** (maintenance photos, rental application documents) — real file storage requires a storage provider key. Without it, you can still select a file in a form, but you'll see a note that it won't be saved.
 - **Rent payment** (Paystack) — requires a Paystack key.
 - **Paid subscription plans** — switched off by default ("Coming Soon") until billing is ready to go live.
-

Visitor flow (not logged in)

1. **Open the home page** and scroll to **Featured Properties Available for Rent**. These are the real, published listings on the platform (up to six, newest first) — not sample data.
2. **Click anywhere on a property card** — a popup opens with the photo area, description, beds/baths/size, amenities, security/power/road scores, and rent. Nothing navigates yet.
3. **Browse with the side arrows** — use the left/right arrows on either side of the popup (or the keyboard's ← / → keys) to step through the properties; the counter (e.g. **2 / 4**) shows where you are, and it wraps around at the ends. Press **Esc**, click **✕**, or click outside to close.
4. **Open the full listing** — click **View Details** in the popup, or the **View Details** button on the card itself (which skips the popup), to reach that property's own page.
5. **Browse All Properties** — takes you to sign in (or, if you're already logged in, to your own property browser: **Discover** for managers, **Browse** for tenants; admins go to their admin

area).

Tenant flow

1. **Log in** at `/login` with your email and password.

2. **Your dashboard** shows your current unit, lease dates, and three quick actions: [Generate Report](#), [Message Manager](#), [Request Repair](#).

3. **Message your manager** — click [Message Manager](#) (dashboard quick action, or the "Messages" link under your Current Property card). This opens a conversation with your property's manager and landlord — created automatically the first time, reused every time after. Type a message and press Enter or click the send icon.

4. **Submit a maintenance request** — click [Request Repair](#).

1. Pick a category (Plumbing, Electrical, HVAC, Structural, Other).

2. Pick an urgency level.

3. Enter a title and description.

4. Optionally attach photos and a preferred access time.

5. Click **Submit Request**. You're returned to your dashboard, and the request now appears under "Track a maintenance request."

5. **Browse and view a property** — open [Browse Properties](#) from the sidebar (or the bottom tab bar on mobile). Click **Details** on any listing to see full information, photos, amenities, and its neighbourhood scores.

6. **Schedule a viewing** — from a property's detail page, click **Schedule Viewing**.

1. Pick a date, then a time slot, and click **Continue**.

2. Fill in your name, email, and phone number.

3. Click **Confirm Viewing**.

7. **Apply to rent a property** — from a property's detail page, click **Apply Now**.

1. **Personal Information**: name, email, phone, date of birth, nationality.

2. **Employment Information**: employment status, employer, income, move-in date, lease duration, occupants, pets.

3. **References**: an emergency contact is required; a previous landlord is optional.

4. **Documents**: upload ID, proof of income, and a bank statement (an employment letter is optional), accept the terms, then click **Submit Application**.

- 8. View payment history** — open [Payment History](#) from the sidebar. Any past rent payments, and an outstanding balance if you have one, appear here, with a **Pay Rent** button when payment is configured.
- 9. Notifications** — the bell icon in the header shows a live count and a popup preview; click it to open the full notifications page.
- 10. Change your password** — open the avatar/Settings area → [Change Password](#), enter your current and new password, and save.
- 11. On a phone**, the sidebar is replaced by a floating bottom tab bar (Dashboard / Browse / Payments / More). Anything that doesn't fit — plus Log Out — lives under **More**. Settings and Sign Out also fold into a single menu off your avatar in the header, instead of three separate icons.
- 12. Log out** via the header (desktop) or the avatar menu (mobile).

Landlord flow

- 1. Log in.** Your dashboard is your **Portfolio** — every property you own, at a glance (total units, occupancy, listed rent).
- 2. View a property** — click **View Details** on any property card to see its full listing, units, and occupancy breakdown.
- 3. List a new property** — click **List Property** (sidebar or bottom tab bar's [More](#) menu on mobile).

1. Property Info: type, address, city, state.

2. Details: bedrooms, bathrooms, size, rent, amenities, utilities.

3. Media Upload: required before review — 360° video, room photos, exterior photos. (Live upload isn't wired yet in this build; there's a "Simulate Upload Complete" stand-in so you can see the rest of the flow — see the setup guide for when this goes live.)

4. Review → **Submit for Verification.** New listings need admin approval before they go live.

4. View your tenants — open [Tenants](#) from the sidebar to see everyone renting from you, their property, rent, and payment status.

5. Open a tenant's detail page — click any tenant to see their lease terms, payment history, and documents. Click **Message Tenant** to open a direct conversation with them (shared with your property manager, so either of you can pick it up).

6. View maintenance requests on your properties from the [Maintenance](#) tab.

7. Change your password and **log out** the same way as any role (see Tenant flow, steps 10–12).

Property manager flow

Everything a landlord can do, plus the day-to-day operational tools:

1. Log in. Your dashboard shows portfolio stats — total properties, active leases, rent collected, pending maintenance — each one clickable through to a detailed breakdown (e.g. **View All Renewals** →).

2. Discover properties — open **Discover Properties**. As the manager of these listings, you'll see a **Create Ad** button on each one (a tenant or vendor browsing the same page won't see it — it's manager/landlord-only).

1. Click **Create Ad**, pick a budget and duration, click **Launch Ad**. The listing now shows "Ad Running" with live impressions/clicks.

2. Click **Cancel Ad** → **Yes, Cancel** to stop it early.

3. Add a tenant — click **Add Tenant**.

1. Tenant Info: name, email, phone (NIN/occupation optional).

2. Link Property: pick a property, then one of its **vacant** units.

3. Lease Details: start/end date (rent auto-fills from the unit, adjustable), frequency, deposit.

4. Review → **Create Tenancy**. You're returned to the tenant list — **the new tenancy starts as Pending**, not Active.

5. Open that tenant from the list and click **Activate Lease** — this is the deliberate second step that actually marks the unit occupied, not a bug in the flow.

4. Manage maintenance requests — open **Maintenance** to see every request across your portfolio. Open one to:

- Click **Message about this request** to reach the shared thread with the tenant (and vendor, once assigned).
- Click **Assign Vendor**, search or pick one from the list — they're notified and the job appears in their queue immediately.
- Once a vendor's invoice is submitted, the request completes automatically by default (configurable in Admin → Platform Settings) — or click **Mark as Completed** yourself at any time.

5. Messages — your inbox lists every conversation across tenants, vendors, and landlords you're connected to.

6. Change your password and log out.

Vendor (service provider) flow

1. Log in. Your dashboard lists your assigned jobs and invoices (one combined view).

2. Open a job — click any job card to see the full request: property, description, priority, photos, and access details.

3. Message the manager about the job — click **Message Manager** to open (or reuse) the thread tied to that specific request; the tenant and landlord are on it too.

4. Update job status as you work — mark it In Progress, and add notes as you go.

5. Create an invoice — once the job's done, click **Mark Complete & Create Invoice**.

1. Add line items (description, quantity, rate) — the total updates live.

2. Click **Submit Invoice**.

3. By default, submitting the invoice **automatically marks the job Completed** — an admin can turn this off platform-wide if vendors need to invoice interim costs without closing out the job early.

6. Change your password and log out.

Admin flow

1. Log in — admins land on `/admin`, a separate area from the tenant/landlord/manager/vendor dashboard. If an admin opens a regular dashboard address (e.g. `/dashboard/discover`), they are sent back to `/admin`.

2. System Overview — a bird's-eye view of the whole platform.

3. User Management — every account on the platform, filterable by role (chips: All / Admin / Manager / Landlord / Tenant / Vendor) and searchable by name, email, or phone.

4. Reports — platform-wide reporting.

5. Platform Settings — currently one live toggle: whether a vendor's invoice automatically completes its maintenance job. Flip it and it takes effect immediately for every request

platform-wide.

6. Notifications — the bell and full notifications page open correctly; note that nothing currently triggers a notification **to** an admin, so this checks the screen itself, not a live alert.

7. Change your password and log out.

Cross-role example: a request from start to finish

This is the same lifecycle a real maintenance issue goes through, with three different people (a tenant, their manager, and a vendor) all acting in their own account, live:

1. **Tenant** clicks **Message Manager** and sends a note — the manager sees it appear in their inbox within a few seconds (messaging polls automatically; no refresh needed).
2. **Manager** replies from their side — the tenant sees the reply appear the same way.
3. **Tenant** submits a new maintenance request (e.g. "Leak in the bathroom").
4. **Manager** sees it appear in their Maintenance list, opens it, and assigns a vendor.
5. **Vendor** sees the job appear in their queue immediately, opens it, and submits an invoice for the completed work.
6. **Both the manager and the tenant** see the request move to **Completed** — automatically, the moment the invoice was submitted.

Known, intentional limits (not defects)

- **Paid subscription checkout** is switched off by default — shows "Coming Soon" instead of a real charge, until billing is ready to go live.
- **Email, file uploads, and rent payment** each depend on a provider key being configured for this deployment (see the note at the top).
- **Adding a tenant is a two-step process** — creating the lease, then separately activating it — by design, not a missed step in the flow.
- **Listing a new property requires admin review** before it goes live — by design, to keep listings trustworthy.
- **Admin notifications** — the screen is real and open correctly, but no platform event currently triggers one; nothing to test there yet beyond the screen opening.

Every flow in this guide was exercised end to end — including the multi-person ones — against a real running build before this document was written, not inferred from the code alone.
