AI-Powered Property Management

Feature Testing Guide

A checklist of every feature, by role, to test by hand before and after each release.

Covers

Visitors, every role, and cross-cutting checks

Format

Checklists grouped by role

A checklist of every flow currently available in Proplity, organized by who would test it. Use this to walk through the app end to end before sign-off.

Before you start: what depends on configuration

A few flows depend on external services being configured for this specific deployment (an email provider, a file-storage provider, a payment provider). If one isn't configured yet, the app doesn't break or behave unpredictably — it clearly says "not available" instead of silently failing. Worth knowing before you test:

- **Email** (verification links, password reset, tenant invites) — real delivery requires an email provider key. Without it, these emails are generated correctly but not actually delivered to an inbox.
- **Photo/document uploads** (maintenance request photos, rental application documents) — real file storage requires a storage provider key. Without it, you can still select a file in the form, but you'll see a clear notice that it won't be saved.
- **Rent payment** (Paystack) — requires a Paystack key, and the live charge call has not yet been run end-to-end against a real test-mode account. Worth a dedicated test pass on its own before relying on it.
- **Paid subscription plans** — intentionally switched off by default (shows "Coming Soon" instead of a real checkout) until billing is ready to go live. Not a bug.

If you hit a "not available yet" message anywhere, that's expected unless told otherwise — check with your technical contact on which of the above are configured for this environment before treating it as a defect.

Before logging in (anyone visiting the site)

- ☐ Browse the marketing site — homepage, "For Landlords," "For Tenants," "For Vendors," About, Contact, Pricing pages
- ☐ Look at a property listing — click into a property and see photos, details, price
- ☐ Featured Properties on the homepage — click a card (a popup opens, the page doesn't navigate), step through with the side arrows (or ← / → keys), close with Esc / × / clicking outside, then click **View Details** to reach the real property page. The card's own View Details button should skip the popup. These are real published listings, not sample data

- ☐ Create an account — sign up as a new user
- ☐ Verify email — click the link sent after signup, **or**, if you don't have it, use the "Didn't get a verification email? Resend it" link right on the login page (works from any device, any time — you don't need the original signup session)
- ☐ Log in / log out
- ☐ Forgot password — request a reset link, set a new password
- ☐ First-time setup (one-time only, your IT/deployer does this once) — create the very first admin account when the app is brand new

Tenant flows

- ☐ Browse available properties and view details on one
- ☐ Schedule a viewing for a property before renting it
- ☐ Apply to rent a property — fill out the application form, including uploading ID and income documents
- ☐ View "my dashboard" — see current lease/unit at a glance
- ☐ Submit a maintenance request (e.g. "kitchen tap is leaking") with photos, urgency level, and a preferred time
- ☐ Track a maintenance request — watch its status change as staff and vendors work on it
- ☐ View payment history — see past rent payments
- ☐ Pay rent (via Paystack)
- ☐ Message their landlord/manager directly in the app
- ☐ View the neighbourhood report for their property (safety, flooding, amenities, etc.)
- ☐ Get notified — a bell icon lights up when something changes (maintenance update, announcement, payment confirmation), with a popup preview and a full notifications page
- ☐ Change password from inside the dashboard (Settings)

Landlord flows

- ☐ List a new property — add address, details, photos
- ☐ View their portfolio — all properties they own, at a glance
- ☐ Add a tenant — set up a new tenant + lease on one of their units (**note**: the lease starts as Pending; open that tenant's page and click **Activate Lease** afterward, which is what actually marks the unit occupied — this is an intentional second step, not a bug)

- ☐ View a tenant's details and lease terms
- ☐ See maintenance requests coming in on their properties
- ☐ Get notified when a tenant pays rent or submits a maintenance request
- ☐ Message tenants, managers, or vendors
- ☐ Change password from inside the dashboard (Settings)
- Subscription/paid-plan checkout exists but is off by default — see note above

Property manager flows

Same as landlord, plus the day-to-day operational tools:

- ☐ Discover/browse properties across the portfolio they manage
- ☐ Manage the tenant list — add, view, and track all tenants
- ☐ Manage maintenance requests — see everything coming in, assign a vendor, track progress to completion
- ☐ View breakdown/reports — drill into numbers (e.g. properties, transactions, maintenance) from the dashboard
- ☐ Message tenants and vendors
- ☐ Change password from inside the dashboard (Settings)

Vendor (contractor) flows

- ☐ See assigned jobs — the maintenance requests they've been assigned to
- ☐ View job details for a specific request
- ☐ Update job status as they work on it (in progress → completed)
- ☐ Create an invoice for a completed job (itemized costs, submit for payment) — **note:** whether submitting an invoice automatically marks the job Completed is a platform-wide setting an admin controls (Admin → Platform Settings); ask what it's set to before assuming either way
- ☐ Get notified when a new job is assigned to them
- ☐ Message the manager/landlord about a job
- ☐ Change password from inside the dashboard (Settings)

Admin flows

- ☐ System overview — a bird's-eye dashboard of the whole platform
- ☐ Admins live in `/admin` — opening a regular dashboard address (e.g. `/dashboard/discover`) or the homepage's "Browse All Properties" should land on `/admin`, never an error page
- ☐ Manage users — view/manage every account on the platform, across all roles
- ☐ View reports
- ☐ Drill into breakdowns — same kind of detail view as managers get, but platform-wide
- ☐ Platform Settings — toggle platform-wide behavior (currently: whether a vendor invoice auto-completes its maintenance job)
- ☐ Open the admin-specific notifications view (bell + full page) — **note**: nothing currently triggers a notification **to** an admin, so there's no in-app action that will make one appear yet; this checks that the screen itself opens correctly, not a live notification
- ☐ Change password from inside the admin panel (Settings)

Cross-cutting things worth testing regardless of role

- ☐ Messaging between any two roles that legitimately need to talk (tenant ↔ manager, manager ↔ vendor, etc.)
 - ☐ Notifications — the bell icon, the popup, the sound, and the full notifications page, for every role
 - ☐ Change password from inside the dashboard — every role has this
 - ☐ Every "Back"/navigation button in the app
-

Known, intentional limits (not defects)

- **Paid subscription checkout** is switched off by default — shows "Coming Soon" instead of a real charge, until billing is ready to go live.
- **Email, file uploads, and rent payment** each depend on a provider key being configured for this deployment (see the note at the top). Ask your technical contact which are live in the environment you're testing.
- **Adding a tenant is a two-step process** — creating the lease, then separately activating it — by design, not a missed step in the flow.
