

Proplity

DEPLOYMENT GUIDE

First-Time Platform Setup

A short, one-time walkthrough for creating your Proplity instance's first administrator account.

Prepared for the deployment/IT team responsible for going live · No coding experience required

This guide walks through the one-time setup step required after your Proplity instance is deployed: creating the platform's first administrator account. It is written for whoever is deploying or configuring the application — no coding knowledge required, just access to the deployed site and its environment configuration.

What this is

A brand-new Proplity deployment has a database with no user accounts in it at all — including no administrator. Before anyone can log in and start managing properties, tenants, or vendors, one administrator account has to be created first.

Proplity includes a **First-Time Setup Wizard** for exactly this: a simple form at `/setup` that creates that first administrator account. Once it's used, it permanently switches itself off — it cannot be run a second time on the same deployment, and the URL becomes inactive.

Before you start

Make sure the following are already true:

- The application has been deployed and is reachable at its production URL (for example, `https://app.yourcompany.com`).
- The database has been migrated (your technical team or deployment pipeline runs this automatically as part of deployment).
- You know the production URL. You do **not** need a username or password yet — that's what this wizard creates.

If your technical team configured a **Setup Token** for extra security (see “Setup Token” below), have that value ready — you'll be asked for it during setup.

Step-by-step

1 Open the setup page

Go to `https://<your-domain>/setup` in a web browser (replace `<your-domain>` with your actual deployment URL). If the page shows the setup form, continue to step 2. If you're instead redirected straight to the login page, setup has already been completed on this deployment — see “Already set up?” below.

2 Fill in the administrator's details

Administrator Name — the name that will appear for this account. **Admin Email Address** — the login email for this administrator (doesn't need to be a working inbox to complete setup, but should be one you can access going forward). **Setup Token** (only shown if required) — enter the value provided by your technical team. **Password / Confirm Password** — at least 8 characters, containing both letters and numbers, and matching each other — shown live as you type.

3 Submit the form

Click **Complete Platform Setup**. This takes a few seconds.

4 Confirmation

On success, you'll see a confirmation screen showing the administrator email that was just created, and a note that the wizard has now permanently disabled itself. You'll be redirected to the login page automatically after a few seconds, or you can click **Proceed to Login**.

5 Log in

Use the email and password you just set to log in. You'll land in the admin console, from which you can create additional accounts, configure properties, and manage the platform.

That's it — setup is complete, and this is a one-time step for the life of this deployment.

Already set up?

If you (or someone on your team) already completed this step, visiting `/setup` again will not show the form — it redirects straight to the login page instead. This is expected and correct: it means the platform already has its first administrator and doesn't need to be set up again.

If you need a **second** administrator account, that's a different, ongoing capability — it's created from inside the admin console after logging in, not through this one-time wizard.

Setup Token (optional extra security)

Some deployments are configured with an additional **Setup Token** — a secret value your technical team sets during deployment. If one is configured, the setup form will show an extra “Deployment Setup Token” field, and setup cannot be completed without the correct value.

This exists to prevent a narrow but real risk: on a fresh deployment, whoever reaches `/setup` first becomes the administrator. If your deployment is reachable on the public internet before you've had a chance to complete setup yourself, a Setup Token ensures only someone who has that value (i.e.,

your own team) can actually complete it. If your team hasn't mentioned a Setup Token to you, your deployment likely isn't using one, and the field won't appear at all.

Troubleshooting

"Platform setup has already been completed."

Someone has already completed this step on this deployment. Use the login page instead. If you believe this is incorrect, contact your technical team — administrator accounts can be added from the admin console once someone is logged in.

"Invalid or missing setup token."

Your deployment requires a Setup Token and either none was entered, or the value entered doesn't match. Confirm the correct value with your technical team.

"Too many setup attempts from this IP. Please try again later."

For security, setup attempts are rate-limited. Wait a few minutes and try again.

The /setup page won't load at all.

This usually means the deployment itself isn't reachable yet, or is still being deployed/migrated. Confirm with your technical team that deployment has finished.

This document covers the one-time initial setup step only. For day-to-day platform administration — adding staff accounts, managing properties, and so on — see the in-app admin console after logging in.
