QA / UAT GUIDE

# End-to-End Testing Guide

A role-by-role checklist of every flow currently available in Proplity — tick items off as you go.

---

Prepared for the testing / UAT team · Checklist format, print or fill in digitally

**Before you start: a few flows depend on configuration.** If one isn't configured yet for this deployment, the app doesn't break — it clearly says “not available” instead of failing silently.

- **Email** (verification, password reset, tenant invites) — needs an email provider key to actually deliver.
- **Photo/document uploads** (maintenance photos, application documents) — needs a storage provider key to actually save files.
- **Rent payment** (Paystack) — needs a payment provider key; the live charge call hasn't been run end-to-end against a real test-mode account yet.
- **Paid subscription plans** — intentionally off by default (shows “Coming Soon”) until billing goes live.

If you hit a “not available yet” message, check with your technical contact on what's configured before treating it as a defect.

## Before logging in

Visitor

- 
- ☐ Browse the marketing site — homepage, “For Landlords,” “For Tenants,” “For Vendors,” About, Contact, Pricing pages
- 
- ☐ Look at a property listing — click into a property and see photos, details, price
- 
- ☐ Create an account — sign up as a new user
- 
- ☐ Verify email — click the link sent after signup, **or** use “Didn't get a verification email? Resend it” right on the login page (works from any device, anytime)
- 
- ☐ Log in / log out
- 
- ☐ Forgot password — request a reset link, set a new password
- 
- ☐ First-time setup (one-time only, your IT/deployer does this) — create the very first admin account when the app is brand new

## Tenant flows

Renter

- ☐ Browse available properties and view details on one
- ☐ Schedule a viewing for a property before renting it
- ☐ Apply to rent a property — fill out the application, including uploading ID and income documents
- ☐ View “my dashboard” — current lease/unit at a glance
- ☐ Submit a maintenance request (e.g. “kitchen tap is leaking”) with photos, urgency level, and a preferred time
- ☐ Track a maintenance request — watch its status change as staff and vendors work on it
- ☐ View payment history — see past rent payments
- ☐ Pay rent (via Paystack)
- ☐ Message their landlord/manager directly in the app
- ☐ View the neighbourhood report for their property (safety, flooding, amenities, etc.)
- ☐ Get notified — bell icon, popup preview, and full notifications page
- ☐ Change password from inside the dashboard (Settings)

## Landlord flows

Owner

- ☐ List a new property — address, details, photos
- ☐ View their portfolio — all properties they own, at a glance
- ☐ Add a tenant — set up a new tenant + lease on one of their units
  - Note: the lease starts as Pending — open that tenant's page and click **Activate Lease** afterward, which actually marks the unit occupied. Intentional two-step process, not a missed step.
- ☐ View a tenant's details and lease terms
- ☐ See maintenance requests coming in on their properties
- ☐ Get notified when a tenant pays rent or submits a maintenance request
- ☐ Message tenants, managers, or vendors
- ☐ Change password from inside the dashboard (Settings)

*Subscription/paid-plan checkout exists but is off by default — see the note at the top.*

## Property manager flows

Operator

---

*Same as landlord, plus the day-to-day operational tools:*

- ☐ Discover/browse properties across the portfolio they manage
- ☐ Manage the tenant list — add, view, and track all tenants
- ☐ Manage maintenance requests — see everything coming in, assign a vendor, track progress to completion
- ☐ View breakdown/reports — drill into numbers (properties, transactions, maintenance)
- ☐ Message tenants and vendors
- ☐ Change password from inside the dashboard (Settings)

## Vendor (contractor) flows

Contractor

- 
- ☐ See assigned jobs — the maintenance requests they've been assigned to
  - ☐ View job details for a specific request
  - ☐ Update job status as they work on it (in progress → completed)
  - ☐ Create an invoice for a completed job (itemized costs, submit for payment)

Note: whether submitting an invoice auto-completes the job is a platform-wide setting an admin controls (Admin → Platform Settings) — confirm which way it's set before assuming.

- ☐ Get notified when a new job is assigned to them
- ☐ Message the manager/landlord about a job
- ☐ Change password from inside the dashboard (Settings)

## Admin flows

Platform owner

- ☐ System overview — a bird's-eye dashboard of the whole platform
- ☐ Manage users — view/manage every account on the platform, across all roles
- ☐ View reports
- ☐ Drill into breakdowns — same detail view as managers get, but platform-wide
- ☐ Platform Settings — toggle platform-wide behavior (currently: whether a vendor invoice auto-completes its maintenance job)
- ☐ Open the admin-specific notifications view (bell + full page)

Note: nothing currently triggers a notification to an admin, so there's no in-app action that will make one appear yet — this checks that the screen itself opens correctly, not a live notification.

- ☐ Change password from inside the admin panel (Settings)

## Cross-cutting

Every role

- ☐ Messaging between any two roles that legitimately need to talk (tenant ↔ manager, manager ↔ vendor, etc.)
- ☐ Notifications — the bell icon, the popup, the sound, and the full notifications page, for every role
- ☐ Change password from inside the dashboard — every role has this
- ☐ Every “Back”/navigation button in the app

## Known, intentional limits (not defects)

**Paid subscription checkout** is switched off by default — shows “Coming Soon” instead of a real charge, until billing is ready to go live.

**Email, file uploads, and rent payment** each depend on a provider key being configured for this deployment (see the note at the top). Ask your technical contact which are live in the environment you're testing.

**Adding a tenant is a two-step process** — creating the lease, then separately activating it — by design, not a missed step in the flow.
